Bladder Pain Treatment Plan

Bladder pain can be caused by many factors. A frequent cause is **damage to the bladder lining** due to infection. This can cause prolonged bladder pain. This can be confusing and frustrating because it feels like the infection is still there, but urine tests show that it is gone. In other cases there is no history of bladder infection at all and the cause is unknown. This condition is also known as **Interstitial cystitis** ("IC.")

Bladder pain can be made worse by many factors including:

stress

diet

sex

Dr Byers has been treating this condition for over 20 years and has found the following plan to be highly effective in reducing symptoms and promoting bladder healing:

Drinking a lot of water to keep urine dilute

Taking a low dose antibiotic either nightly or after sex, to reduce UTI risk

Modifying the diet to reduce irritants (acidic and spicy foods, alcohol, caffeine and soda)

Taking Prelief ("Tums for your bladder," Prelief.com) with with dietary irritants & meals

Taking Bladder Rest daily (icnsales.com/bladder-rest) which helps the bladder heal

Taking Uribel or Urogesic blue prescription medication to reduce symptoms (may not be covered by insurance, ask for a coupon and as the pharmacy for the cash price)

You may be scheduled for an office cystoscopy to evaluate your bladder lining. The bladder usually appears normal but occasionally an ulcer is found and treatment of the ulcer results in rapid symptom improvement. Some bladder cancers can cause bladder pain but this is rare.

If your symptoms are very severe or are not responding to the above plan, we may recommend:

Antihistamines - Zyrtec or hydroxyzine - to reduce allergy-related symptoms

Bladder instillations of heparin and lidocaine, to coat the bladder and reduce pain

Cystoscopy with fulguration of Hunner's ulcers, if present

Hydrodistension under anesthesia - rarely used but often successful in severe cases

Chronic cases of bladder pain without infection are known as "IC" or interstitial cystitis. Most cases of bladder pain, including those we would consider "IC," improve with treatment, but it takes time. Generally you can expect improvement to be proportional to the length of time you have had symptoms. For instance if symptoms started 6 months ago, you can expect improvement in about 3 months. "Flares," sudden increases in symptoms that feel like UTIs, will become less frequent and less severe.
